

Abstract

A nozzle holder and device
for extruding dough materials

5

A nozzle holder (14) with at least one nozzle (34'; 34''),
which ends at a mouth (38'; 38''), is used for
manufacturing baking articles (54) from an extruded strand
(56). In order to manufacture baking articles (54) which
10 extend in a plane, the nozzle (34'; 34'') is pivotably
mounted by means of a joint with a ball (32) and its mouth
(38'; 38'') is displaceable by a pivoting device (45) in
two axes (X; Y) extending at right angles to one another.
Furthermore, constructed in the ball (32) is at least one
15 connecting duct (48'; 48''), of which one end is connected
to a stationary feed duct (50'; 50'') and the other end to
the pivotable nozzle (34'; 34'').
